

Hector Rubalcava

Architecture Dossier

For CTOs and Principal Engineering Leaders

drkengine.tech • github.com/drkengine • linkedin.com/in/hector-rubalcava • hello@drkengine.tech

Architecture Philosophy

- â€¢ Treat software as living infrastructure: observable, evolvable and operationally accountable.
- â€¢ Use architecture as a control surface connecting business rules, reliability and delivery speed.

Engineering Evolution

- â€¢ Progression from Linux/Red Hat operations and NGINX load balancing to cloud and distributed architecture.
- â€¢ Evolution through API governance, infrastructure automation and serverless standards.
- â€¢ Expansion into financial systems depth, incident reasoning and AI-assisted operational intelligence.

Migration and Modernization Strategy

- â€¢ Decouple monoliths incrementally with event boundaries and integration governance.
- â€¢ Move on-premise services to AWS ECS while preserving continuity and control points.
- â€¢ Standardize runtime patterns to reduce drift and improve repeatability.

Governance and Operational Intelligence

- â€¢ Apigee/OpenAPI governance for policy consistency, security enforcement and traffic stability.
- â€¢ Operational automation through bots, workflow integrations and centralized signal handling.
- â€¢ Incident response informed by telemetry, dependency awareness and containment strategies.

AI-Augmented Context Systems

- â€¢ RAG-based business context extraction for architecture and operational decision support.
- â€¢ AI used as an operational multiplier, not a replacement for architecture discipline.

Strategic Value

- â€¢ Transforms technical complexity into controlled, scalable and business-aligned execution models.
- â€¢ Bridges platform engineering, financial domain understanding and intelligent automation.
